Risa Fletcher
CS290: Intro to Web Development
Activity 6

For this project I followed the suggested project of expanding the todo app. For setting up the forms and general structure of this application I have a good grasp on. I don't have any issues in getting the forms to take in user data. I also did not face any problems setting up my HTTP requests for POST or GET. I was able to look back at last week's assignment and some of the problems I came across. These were issues because I made silly mistakes while setting up the header correctly.

With the new sessions information, when attempting to destroy the session I had to play around with when to include the req.session.destroy(); because it interfered with tracking the different sessions. Another issue I faced was keeping organized, particularly with nested asynchronous calls. I got a lot out of the reading and also I think this will get easier with practice and planning out code better.
